

## Replacing the SD Card

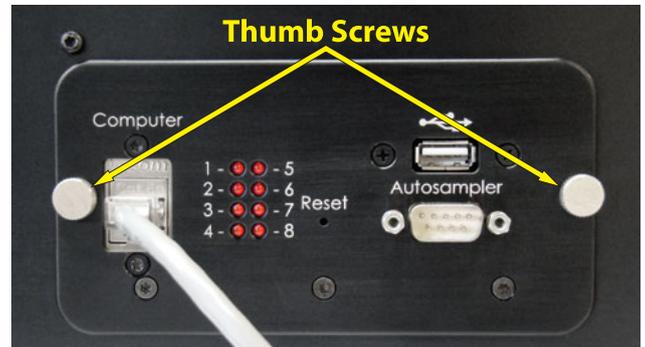

### Materials

- Blank SD Card

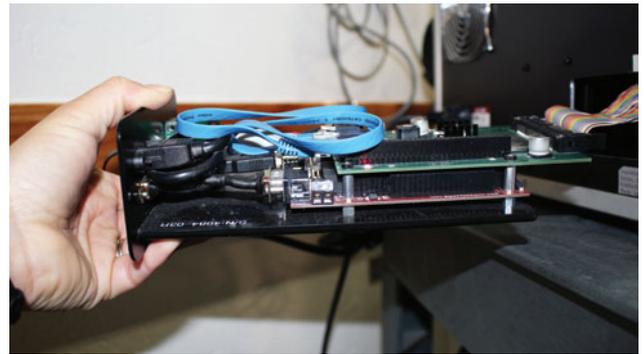

### Protocol

- 1. Turn the instrument off.** Make sure all the LED lights are off on the indicator panel before proceeding.
- Remove the Ethernet cable (and Autosampler cable if present) from the instrument controller board located on the back of the instrument (**Figure 1**).
- Remove the thumb screws and slide the instrument controller board out of the instrument (**Figure 2**).
- Remove the old SD Card (**Figure 3**).
  - Press on the SD card to unlock it from the Controller, then slide it out of the mount.
- Place the new SD Card in the mount.
  - Press on the SD card to lock in place.
  - There will be a slight “Click” if it is in the right position.
- Slide the instrument controller board back in the instrument and re-install the two thumb screws, Ethernet cable, and Autosampler cable (if present).
- Turn the instrument on. Make sure the error and busy lights are off on the indicator panel before proceeding.
 

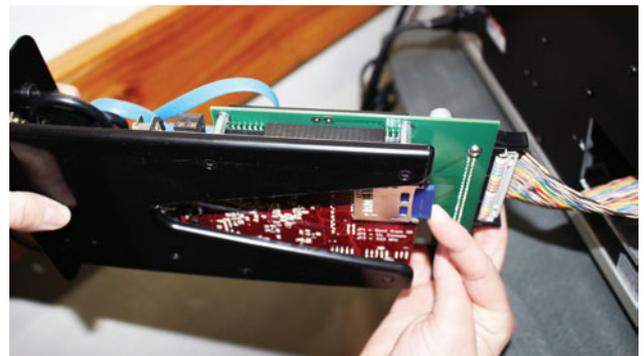

**Note:** It may take up to 10 minutes for initialization and the lights on the indicator panel to go off.
- Open the KinExA Pro software. Select **Help** from the menu and then **About KinExA Pro**.
- Make sure the “Free Space” value shown is greater than 90%. If the free space is less than 90%, the SD card may not be mounted properly. Perform procedures 1 - 9 again.
- Contact a Sapidyne representative with any questions.

**Figure 1.** Instrument controller board. Yellow arrows point to the thumb screws. Not all controller board panels have LED lights and a USB port. The Autosampler 9-pin serial cable (not shown) must also be removed if one is connected. The procedure for replacing the SD Card is the same for all controller styles.

**Figure 2.** Slide the instrument controller board out of the instrument.

**Figure 3.** Remove the old SD card.
